

$$\frac{\mathrm{d}}{\mathrm{d} x} (u \cdot v) = \frac{\mathrm{d} u}{\mathrm{d} v} \cdot v + u \cdot \frac{\mathrm{d} v}{\mathrm{d} x} \quad (1.1)$$

$$\frac{\mathrm{d}}{\mathrm{d} x} (f(x) \cdot g(x)) = f'(x) \cdot g(x) + f(x) \cdot g'(x) \quad (1.2)$$

$$\frac{\mathrm{d} \, y}{\mathrm{d} \, x} = \frac{\mathrm{d} \, y}{\mathrm{d} \, u} \cdot \frac{\mathrm{d} \, u}{\mathrm{d} \, x} \qquad (1.3)$$

$$\frac{\mathrm{d}}{\mathrm{d} \, x} [f \, (g \, (x))] = f' \, (g \, (x)) \cdot g \, (x) \qquad (1.4)$$

$$\int f(g(x)) \cdot g'(x) \, dx = \int f(u) \, du \quad (1.5)$$

$$\int f(u) \cdot \frac{du}{dx} \, dx = \int f(u) \, du \quad (1.6)$$

A hand-drawn mathematical equation  $x = f(x)$  in a pixelated, black-and-white style. The variable  $x$  is on the left, followed by an equals sign consisting of two parallel horizontal lines. To the right of the equals sign is the function notation  $f(x)$ , where the letter  $f$  is a tall, thin character and the argument  $x$  is enclosed in large, curved parentheses.

$$\frac{d}{dx}[\sin(x)] = \cos(x)$$

$d v = d x$

$$\int u \, dv = u \cdot v - \int v \, du \quad (1.7)$$

$$\begin{aligned}
 u &= g(x) & F(x) &: F'(x) = f(x) = y \\
 \frac{du}{dx} &= g'(x)
 \end{aligned}
 \tag{1.8}$$

$$\begin{aligned}
& \frac{\mathrm{d}}{\mathrm{d} x} [F' (u)] = F' (g (x)) \cdot g' (x) \\
& \qquad \qquad \qquad = f (g (x)) \cdot g' (x) \\
\implies & f (g (x)) \cdot g' (x) = \frac{\mathrm{d}}{\mathrm{d} x} [F (u)] \\
& f (g (x)) \cdot g' (x) = \frac{\mathrm{d}}{\mathrm{d} x} [F (u) + C]
\end{aligned}
\tag{1.9}$$

$$\begin{aligned}
 \int f(g(x)) \cdot g'(x) \, dx &= \int \frac{d}{dx} [F(u) + C] \, dx \\
 &= F(u) + C \\
 &= \int f(u) \, du
 \end{aligned}$$

$$\int f(g(x)) \cdot g'(x) \, dx = \int f(u) \, du$$

$$\int f(u) \cdot \frac{du}{dx} \, dx = \int f(u) \, du$$

12)

$$\frac{\mathrm{d}}{\mathrm{d} x} [f(x) \cdot g(x)] = f'(x) \cdot g(x) + f(x) \cdot g'(x) \quad (1.10)$$

$$\begin{aligned} u &= f(x) & v &= g(x) \\ \frac{du}{dx} &= f'(x) & \frac{dv}{dx} &= g'(x) \end{aligned} \tag{1.11}$$

$$\int \left( \frac{\mathrm{d} u}{\mathrm{d} x} \cdot v + u \cdot \frac{\mathrm{d} v}{\mathrm{d} x} \right) \mathrm{d} x = u \cdot v$$

$$\int \left( v \cdot \frac{\mathrm{d} u}{\mathrm{d} x} \right) \mathrm{d} x + \int \left( u \cdot \frac{\mathrm{d} v}{\mathrm{d} x} \right) \mathrm{d} x = u \cdot v$$

10)

$$\int v \, \mathrm{d} u + \int u \, \mathrm{d} v = u \cdot v$$

$$\int u \, \mathrm{d} v = u \cdot v - \int v \, \mathrm{d} u$$

$$\left[ f(x) \cdot \frac{dx}{dx} \right] = \left[ f(g(x)) \cdot g'(x) \right]$$

$$\left[ f(x) \cdot \frac{d}{dx} \right] = \left[ f(x) \cdot g'(x) \right]$$

$$\sum_0^n \left[ a_0(x) \cdot \left( \frac{d^n y}{d x^n} \right) \right] \qquad (1.12)$$

A differential equation of the form:

$$g(y) \cdot \frac{dy}{dx} = f(x) \quad (1.13)$$

Is a seperable Ordinary Differential Equation and has a solution:

$$\int g(y) dy = \int f(x) dx \quad (1.14)$$

$$g(y) \cdot \frac{\mathrm{d} y}{\mathrm{d} x} = f(x)$$

$$\Rightarrow \int g(y) \frac{\mathrm{d} y}{\mathrm{d} x} \mathrm{d} x = \int f(x) \mathrm{d} x$$

(1.15)

$$\int g(y) \, \mathrm{d}y = \int f(x) \, \mathrm{d}x \qquad (1.16)$$

$$\frac{dy}{dx} = f\left(\frac{x}{y}\right)$$

$$u = \frac{y}{x}$$

$$\implies y = u \cdot x$$

$$\implies \frac{\mathrm{d} y}{\mathrm{d} x} = \frac{\mathrm{d} u}{\mathrm{d} x} \cdot x + (1) \cdot u$$

$$\frac{\mathrm{d} y}{\mathrm{d} x}=f\left(\frac{y}{x}\right)$$

$$\frac{\mathrm{d} u}{\mathrm{d} x} \cdot x+u=f(u)$$

$$\frac{\mathrm{d} u}{\mathrm{d} x} \cdot x=f(u)-u$$

$$\frac{1}{f(u)-u} \cdot \frac{\mathrm{d} u}{\mathrm{d} x} \cdot x=1$$

$$\frac{1}{f(u)-u} \cdot \frac{\mathrm{d} u}{\mathrm{d} x}=\int \frac{1}{x} \mathrm{d} x$$

$$\int \frac{1}{f(u)-u} \cdot \frac{\mathrm{d} u}{\mathrm{d} x} \mathrm{d} x=\int \frac{1}{x} \mathrm{d} x$$

$$\int \frac{1}{f(u)-u} \mathrm{d} u=\ln |x|+c \quad (1.17)$$

$$\exists G(x) : G(x) \equiv \int \frac{1}{f(x)-x} dx$$

$$G(u) = \ln |x| + c$$

$$G\left(\frac{y}{x}\right) = \ln |x| + c$$

$$G\left(\frac{y}{x}\right) + \ln |x| + c = 0 \tag{1.18}$$

$$\sum_0^n \left[ a_n(x) \cdot f^{(n)}(x) \right] = g(x)$$

If  $g(x) = 0$  it is said to be homogenous

$$a_1(x) \cdot \frac{dy}{dx} + a_0(x) \cdot y = g(x)$$

Where  $a(x)$  is a function (1.19)

## Linear First Order ODE:

$$\frac{dy}{dx} + p(x) \cdot y = f(x) \quad (1.20)$$

if  $f(x) = 0$  the equation is said to be homogeneous

$$y_n \cdot \frac{d y_n}{d x} + p(x) \cdot y_n = 0$$

$$y_p := \frac{d y_p}{d x} + p(x) \cdot y_p = f(x)$$

1. Rewrite the Equation in the standard form:

$$\frac{dy}{dx} + p(x) \cdot y = f(x)$$

2. Identify  $p(x)$  and find the integrating factor:

$$e^{\int p(x) dx}$$

3. Multiply through by the integrating factor:

$$e^{\int p(x) dx} \left( \frac{dy}{dx} + p(x) \cdot y \right) = e^{\int p(x) dx} f(x)$$

It may be concluded:

$$\frac{d}{dx} \left[ e^{\int p(x) dx} \cdot y \right] = e^{\int p(x) dx} \cdot f(x)$$

4. Integrate both sides in order to solve:

$$\frac{dy}{dx} + p(x) \cdot y = f(x) \qquad (1.21)$$

$$\frac{\mathrm{d} y}{\mathrm{d} x} + p(x) \cdot y = 0 \quad \Longrightarrow \quad y = y_h \quad (1.22)$$

$$\frac{\mathrm{d} y}{\mathrm{d} x} + p(x) \cdot y = f(x) \quad \Longrightarrow \quad y = y_p \quad (1.23)$$

$$\frac{d}{dx} (y_h + y_p) + p(x) \cdot (y_h + y_p) = f(x)$$

$$\frac{dy_h}{dx} + \frac{dy_p}{dx} + p(x) \cdot y_h + p(x) \cdot y_p = f(x)$$

$$\frac{dy_h}{dx} + p(x) \cdot y_h + \frac{dy_p}{dx} + p(x) \cdot y_p = f(x)$$

$$0 + f(x) = f(x)$$

(1.24)

$$\frac{\mathrm{d} y}{\mathrm{d} x} + p(x) \cdot y = 0$$

$$\frac{1}{y} \cdot \frac{\mathrm{d} y}{\mathrm{d} x} = -p(x)$$

$$\ln |y| = \int -p(x) \mathrm{d} x + c$$

$$|y| = e^{\int -p(x) \mathrm{d} x} \cdot e^c \quad (1.25)$$

$$\Rightarrow y_h = e^{-\int p(x) dx} \cdot c$$

$$v_1 = e - \int p(x) dx$$

$$y_h = y_1(x) \cdot c \qquad (1.26)$$

$x(x)$

$$\begin{aligned}
 y_p &= u(x) \times y_h(x) \\
 &= e^{-\int p(x) \, dx} \cdot u(x)
 \end{aligned}
 \tag{1.27}$$

$$y_p = e^{-\int p(x) \, dx} \cdot u(x)$$

$$\frac{dy_p}{dx} + p(x) \cdot y_p = f(x)$$

$$\frac{d}{dx} (u(x) \cdot y_1(x)) + p(x) u(x) y_1(x) = f(x)$$

$$\frac{du}{dx} \cdot y_1(x) + \frac{dy_1}{dx} \cdot u(x) + p(x) \cdot u(x) \cdot y_1(x) = f(x)$$

$$u(x) \left( \frac{dy_1}{dx} + p(x) y_1 \right) + \frac{dy}{dx} \cdot y_1(x) = f(x)$$

$$0 + \frac{dy}{dx} \cdot y_1(x) = f(x)$$

$$\frac{dy}{dx} = f(x) / y_1(x)$$

$$\int \frac{dy}{dx} \, dx = \int f(x) / y_1(x) \, dx$$

$$\int dy = \int f(x) / y_1(x) \, dx$$

$$y = \int f(x) / y_1(x) \, dx$$

$$(1.28)$$

$$u = \int f(x) \cdot e^{\int p(x) dx} dx \quad (1.29)$$

$$y_p = \frac{1}{y_1} \cdot \int f(x) \cdot e^{\int p(x) dx}$$

$$y_p = e^{-\int p(x) dx} \int f(x) \cdot e^{\int p(x) dx} \quad (1.30)$$

exp( dx )

$$e^{\int p(x) \, dx} \cdot y_p = e^{\int p(x) \, dx} \cdot e^{-\int p(x) \, dx} \int f(x) \cdot e^{\int p(x) \, dx}$$

$$e^{\int p(x) \, dx} \cdot y_p = \int f(x) \cdot e^{\int p(x) \, dx}$$

$$\frac{d}{dx} \left( e^{\int p(x) \, dx} \cdot y_p \right) = \frac{d}{dx} \left( \int f(x) \cdot e^{\int p(x) \, dx} \right)$$

$$= f(x) \cdot e^{\int p(x) \, dx}$$

$$e^{\int p(x) \, dx} \frac{dy}{dx} + p(x) \cdot e^{\int p(x) \, dx} \cdot y = e^{\int p(x) \, dx} \cdot f(x)$$

$$\implies \frac{dy}{dx} + p(x) \cdot y = f(x)$$

$$(x+1) \cdot \frac{dy}{dx} + y = \ln(x) \quad ; \quad y(1) = 10 \quad (1.31)$$

$$\frac{dy}{dx} + \frac{y}{x+1} = \frac{\ln(x)}{x+1} \quad : \quad (x \in \mathbb{R} \setminus \{-1, 0\})$$

(1.32)

$$\begin{aligned}
 u &= e^{\int \frac{1}{x+1} \, dx} \\
 &= e^{\int \ln |x+1| \, dx} \\
 &= |x+1|
 \end{aligned}
 \tag{1.33}$$

$$\begin{aligned} & (x+1) \cdot \frac{dy}{dx} + y = \ln(x) \\ \Rightarrow \frac{d}{dx} ((x+1) \cdot y) &= \ln(x) \end{aligned}$$

(1.34)

$$\int \frac{d}{dx} [(x+1) \cdot y] dx = \int \ln(x) dx$$

$$(x+1) \cdot y = \int \ln(x) \, dx$$

(1.35)

$$u = \ln(x) \quad dv = dx$$

$$du = \frac{1}{x} dx \quad v = x$$

$$\Rightarrow \int u \, dv = u \cdot v + \int v \, du$$

$$\begin{aligned}
 (x+1) \cdot y &= \ln(x) \cdot x - \int \mathrm{d} x \\
 &= x \cdot (\ln(x) - 1) + c \\
 \implies y &= \frac{x \cdot (\ln(x) - 1 + c)}{x+1}
 \end{aligned}$$

21 = 10

$$10 = \frac{1 (\ln (1) - 1 + c)}{2}$$

$$20 = 1 (0 - 1) + c$$

$$c = 19 \qquad (1.36)$$

$$y \equiv x(\ln(x) - 1 + 19) \frac{1}{x+1}; \quad \forall x \in \mathbb{C} \setminus \{-1, 0\}$$
