References

1

You will need to install the `org-ref` package by following the instructions on their [GitHub](#), you need to add a line to your `.emacs.d/.init.el` but then you should be able to do `M-x package-list-packages` and find `org-ref` in order to install it.

With my dotfiles I then use `, i c` to insert a citation with helm that looks through all of the `references.bib` (which is built by zotero using the [better bibtex](#) extension)

The export to \LaTeX and export to html both produce references for me with the dotfiles and the latex style.

I'm using Lots of citations [2] like this one on differential equations [4] and this one [3] the *TidyVerse* Style guide and this one [1] on computer font.
