## Spacemacs is slow

## Doom Config

## Code Folding

```

1  ## vim:fdm=expr:fdl=0
2  ## vim:fde=getline(v\:lnum) =~ '^##'? '>' . (matchend(getline(v\:lnum), '##*')
   ↪   )-2)\: '= '

```

## Source Code Blocks

There's a lot you can do with these, basically the two things you'll want to do are:

### 1. [Disable evaluation of blocks on export](#)

(a) For the Whole File

(b) For only that headline

(c) For only that Code Block test

### 2. [Set System Wide Settings](#)

### 3. [Change what's exported](#)

# Emacs Application Framework

Install the dependencies

To install it

```
1 cd ~/.emacs.d/site-lisp
2 git clone
  ↪ https://github.com/manateelazycat/emacs-application-framework.git
  ↪ --depth=1
```
